

Open Source Universal Authentication SDK

First GSMA Open Gateway, CAMARA-compatible solution for phone verification, user authentication and fraud prevention.

One universal SDK. Multiple phone verification and authentication channels.

Combine Direct Carrier Network signals with Smart Fallbacks (OTP and IM) to onboard, verify, and protect your mobile app users in seconds.

Android Universal Authentication SDK

iOS Universal Authentication SDK
<https://github.com/ipification/ipification-ios-sdk>

The main reason for choosing the IPification SDK

Built-in Smart Fallback is a waterfall-based system.

The SDK doesn't pick a single channel—it runs a real-time decision loop, probing network conditions and carrier availability, and automatically routing each authentication attempt through the best available method.

You can set your channel fallback logic through the SDK setup.

1. Try **Auth Methods** (in any order):

SIM

IP

SMS

IM

2. Any available and successful?

► **YES** (Phone Number Verified)

► **NO** (Verification Failed)

A few available automations:

- 1 **One of the biggest hurdles for silent authentication is Wi-Fi.** Our SDK solves this by leveraging SIM-based authentication when available, or by forcing a cellular data connection for the specific authentication request. The user stays on Wi-Fi for everything else and never notices. But the auth request carries a carrier-assigned IP, so the match succeeds.
- 2 **It supports phone number pre-population** for silent number verification, so the user doesn't have to type in the phone number by hand. IPification's technology can read the user's phone number from the SIM or Google Hint. Available only on Android SDK.
- 3 **Dual-stack API handling - IPv4 as well as IPv6.** The SDK detects which IP version the device presents on the mobile data interface and routes the auth request over the correct stack (v4 or v6) to ensure the carrier sees the correct IP for the successful authentication.
